PROFESSIONAL SUMMARY

DevOps engineer who likes finding out why a system actually broke, not just patching what's visible. Comfortable moving between Linux internals, CI pipelines, and container networking to get to the real cause. I care about systems being dependable for the people who rely on them, and I bring that habit to everything I work on, even early in my career.

EDUCATION

Jordan University of Science and Technology

Bachelor of Engineering in Network Engineering — GPA: 3.64/4.0

Irbid, Jordan

Graduated

- Dean's List, 2023–2024

EXPERIENCE

Jordan Open Source Association (JOSA)

Open Source Developer — OpenLab Apprentice

Amman, Jordan

May 2026 – Present

- Profiled Woodpecker CI's Go YAML validation with pprof, identified repeated schema compilation, and introduced sync.Once caching; reduced CPU profile duration by 86.2% across 20 runs in a merged open-source contribution.
- Diagnosed and resolved a cascading network failure across a KVM/libvirt/Minikube stack by isolating the root cause to an iptables FORWARD chain DROP policy and a misconfigured firewall backend, unblocking driver-related issues and ensuring reliable operation of the on-premise Minikube cluster.
- Deployed and operated a self-hosted Woodpecker CI instance exposed via Cloudflare Tunnel on a custom domain, investigating and resolving server/agent failures spanning DNS resolution, tunnel backend configuration, authentication timeouts, and agent configuration persistence, restoring 100% uptime for the instance.
- Audited Meshery's Go and npm dependencies with Trivy, govulncheck, and npm audit, proposing fixes for six Go advisories and seven npm vulnerabilities, reducing npm findings from 17 to 10 on the PR branch and improving the OpenSSF Scorecard score from 5/10 to 7/10.

8BillionMinds

DevOps Volunteer

Tadworth, United Kingdom

Feb 2026 – May 2026

- Analyzed application telemetry in Grafana to identify notification delivery failures affecting 91% of students, tracing the issue to a hardcoded SQL query in a Java/Spring application and correcting it to restore delivery.

42Irbid

Software Engineering Apprentice

Irbid, Jordan

Jun 2025 – Present

- Built and troubleshooted a Docker Compose stack with NGINX, PHP-FPM, WordPress, and MariaDB, resolving service health, networking, volume, and file-permission issues across container boundaries.
- Implemented GitHub Actions workflows for training projects to automate compilation, linting, formatting, and testing on pull requests.

PROJECTS

Inception — Containerized Web Stack

- Deployed NGINX, WordPress, and MariaDB as three Docker Compose services with a single TLS entry point, isolated network, health-gated startup, secrets, and persistent volumes.

TECHNICAL SKILLS

Languages: Go, Python, Bash, C, TypeScript, Java, SQL

Systems & Containers: Linux, Docker, Docker Compose, Kubernetes, AWS, NGINX, Networking, DNS, TLS, Cron Jobs, KVM, libvirt, Minikube, iptables

Delivery & Diagnostics: CI/CD, Woodpecker CI, GitHub Actions, Terraform, Prometheus, Grafana, Git, pprof, Valgrind, govulncheck, npm audit, Trivy, Cloudflare Tunnel

Backend: Node.js, Express, Spring, Kafka, MariaDB, PostgreSQL, WordPress, PHP-FPM

Concepts: Site Reliability Engineering, Observability, Infrastructure as Code, Incident Management, Root Cause Analysis, Service Level Objectives (SLOs), Capacity Planning

AWARDS & ACHIEVEMENTS

- **Top 20** — National CTF Competition (NCSC)
- **Winner** — **Best Use of MongoDB Atlas** — HackThisFall 2024

CERTIFICATIONS & LANGUAGES

Languages: Arabic (Native), English (Professional Proficiency)
